This protein was produced by the human tumour cell line HUOCA-II or HUOCA-III. Was protein enhances the formation of new blood vessels and may be used to enhance healing of wounds, burns injuries, decubitus or post-operative tissue damage. It may also be used as a drug for

                                                                                                                                                                                                                                                                     A pig liver derived cultured epithelial cell line was cultured pumber, cow embryo serum and N-2-hydroxyethylpierazine ethane sulphonic acid to confluence. The medium was then changed to se and glucose free DMEM, and the oxygen concentration reduced to than 2%. The cells were cultured for 6 hours, and then for anoth hour at 95% air/5% carbon dioxide (recxygenation). HGF was added just before hypoxiation or reoxygenation. HGF suppressed free lactic acid dehydrogenase (LDH) by 49.6% when added before hypoxiation, and by 60.9% when added before reoxygenation, at 51.
                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is the human hepatic parenchymal cell growth factor (HGF), which has a molecular weight of 76-92 kD estimated by SDS-PAGE, parenchymal cell growth activity, which is lost following heat treatment at 80 degrees C for 10 minutes and strong affinity towards heparin. It may be used to treat and prevent ischaemic diseases, e.g. blood reperfusion disorder, is chaemic reperfusion disorders in liver transplant, acute liver failure and organ disorder during organ transplant. For adults, it is administered at a level of 1 microg to 10 mg/kg/day, preferably 10-1000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim

This sequence represents the wild type full length sequence of human CC hepatocyte growth factor (HGF). HGF is isolated from human serum CC and is a disulphide linked heterodimer derived by proteolytic cleavage of this pro-hormone form between residues 494 and 495. This generates a CC molecule composed of an alpha-subunit of 440 amino acids (mol. wt. 69 CC kD) and a beta-subunit of 234 amino acids (mol. wt. 34 kD). The alpha CC and beta subunits are encoded by a single open reading frame. The alpha CC subunit contains four kringle domains based on their homology to kringle-like domains in other proteins, e.g. prothrombin, plasminogen. CC kringle-like domains in other proteins, e.g. prothrombin, plasminogen. The beta subunit shows high homology to the catalytic domain of serine proteases. However two of the three residues which form the catalytic contains four the other proteases are not conserved in HGF. Therefore, the precise function of the beta chain remains unknown. The invention includes HGF variants which retain HGF receptor binding activity without having the biological activity of wild-type HGF. They can be used for the treatment of pathological conditions associated with the activation of a HGF receptor schivation.

                                                                                                                                                                                                                                Qy
                                                                                                                                                                                                                                                                                                                          This is the amino acid sequence for human leukocyte-derived
C hepatocyte growth factor (HGF) HLC3, deduced from a cDNA clone
C (see AAV53626) obtained from a leukocyte cDNA library. Another
C leukocyte-derived HGF, HLC2 (see AAW5923), was identified that
C differs from HLC3 by having amino acid residues 162-166 deleted.
C a claimed method of producing a HGF comprises: transforming
C mammalian cells (preferably CHO cells) with a recombinant
C expression vector that has a promoter (preferably the SV40 early
C promoter), a gene coding for human leukocyte-derived HGF, and the
C dilydrofolate reductase gene; (b) culturing the transformed cells
C methotravate; and (c) recovering the HGF polypeptide from the
C culture supernatant. HGF polypeptides may be used as hepatocyte
C research on liver function, research on the action of various
C hormones and drugs on hepatocytes, research on the carcinogenesis
C mechanism of hepatoma, clinical diagnostic reagents using an
antibody against the polypeptide and therapeutic drugs for liver
                                                                                                                                                                                                                                                            Matches

The protein is used in the inner aqueous phase of a W/O/W emulsion. The emulsion also contains an oil phase and an outer aqueous phase. The emulsified composition can considerably extend the blood half life of HGF. The emulsion is used in therapeutical drugs ideliver HGF to hepatic tissues in patients. It is useful for the treatment of hepatic diseases such as acute hepatitis and chronic

It has physiological activity, and using it enhanced growt of hepatocytes is possible. It is useful as a clinical diagnostic reagent, or a drug for treating hepatic disease.

                                                                   The gene encodes an inhibitor of HGF, which has a molecular weight of ca. 76000 to 92000 as determined by SDS-PAGE. Human modified (NP) HGF-A and -B fragments were prepared from human HGF CDNA. This was amplified by PCR to give a human NP-HGF DNA fragment that was transformed into E.coli. (see AAQ47833) for a related sequence

There are 4 kringle domains in the alpha-chain, similar to that of plasmin; the beta-chain has about 37 per cent homology with the beta-chain of plasmin having serine protease activity. Homology of the amino acid sequence of rat HGF and human HGF is 91.6 per cent in the alpha-chain and 88 9 per cent in the beta-chain. HGF has been found to be an agent for nephrocyte growth and is useful as a treatment for renal failure.

                                                                                                                         The present sequence represents a human hepatocyte growth factor (HGF) variant. The HGF variants of the invention bind to the HGF receptor, but are substantially unable to bind heparan sulphate proteoglycan. The HGF variants are useful in medicine e.g. variants having the same effects on while antagonistic variants can be administered to patients requiring HGF, antagonists. They are especially useful for treating cancer. Some of the mitogenic activity than wt-HGF in rats. They are therefore useful give greater therapeutically as wt-HGF, but may have superior effects in vivo, e.g. give greater tissue penetration and ability to reach cell or tissue

This is used to transform host cells for recombinant expression of the human hepatic parenchymal cell growth factor (hHGF). hHGF is useful in the treatment of hepatic diseases, e.g. cirrhosis. It is produced in large amts., stably using this method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatic parenchymal cell growth factor - promethods, useful for e.g. treating cirrhosis

                The present sequence represents a human hepatocyte growth factor (HGF) variant. The HGF variants of the invention bind to the HGF receptor, but are substantially unable to bind heparan sulphate proteoglycan. The HGF variants are useful in medicine e.g. variants having the same effects on target cells as wt-HGF can be administered to patients requiring HGF, while antagonistic variants can be administered to patients requiring HGF, while antagonists. They are especially useful for treating cancer. Some of the variants have a longer circulatory half-life in vivo and a greater mitogenic activity than wt-HGF in rats. They are therefore useful therapeutically as wt-HGF, but may have superior effects in vivo, e.g.
                                                                                                                                           Disclosure;
                                                                                                                                                                Hepatocyte growth factor variants - binding to hepatocyte growth factor receptor, useful in medicine e.g. for cancer therapy

HLC2 a cDNA library prept for five residues, 162-166, which do not appear in HLC3. The DNA sequence can be expressed and the resulting protein, recombinant HGF, used in hepatocyte cultivation, liver regeneration, hepatocyte research, esp. the mechanism of hepatoma, and to prepare anti-HGF antibodies for diagnosis and therapy.

```
C; Function:

A; Description: dissolves the fibrin of blood clots; acts as a proteolytic factor in a ns the walls of the graafian follicle; also activates the urokinase-type plasminogen ns the walls of the graafian follicle; also activates the urokinase-type plasminogen ns the walls of the graafian follicle; also activates the urokinase-type plasminogen status protein protein precursor homolog; plasminogen fibrinolysis; glycoprotein; hydrolase; kidney; kringle; plasminogen fibrinolysis; glycoprotein; hydrolase; kidney; kringle; plasminogen plasminogen protein precursor homology 
F; 1-26/Domain: plasminogen fibrinolysis; glycoprotein; hydrolase; kidney; kringle; plasminogen plasminogen protein precursor homology

plasmin (EC 3.4.21.7) precursor - mouse
N;Contains: angiostatin; plasminogen
C;Species: Mus musculus (house mouse)
C;Date: 20-Sep-1991 #sequence_revision 01-Nov-1996 #text_change 18-Jun-1999
C;Accession: A38514; S48202; S48203
R;Degen, S.J.F.; Bell, S.M.; Schaefer, L.A.; Elliott, R.W.
Genomics 8, 49-61, 1990
A;Title: Characterization of the cDNA coding for mouse plasminogen and localizat A;Reference number: A38514; MUID:91184812
A;Accession: A38514
A;Molecule type: mRNA
A;Residues: 1-812 < DEG>
A;Cross-references: GB;J04766; NID:9200402; PIDN:AAA50168.1; PID:9200403
R;Lijnen, H.R.; van Hoef, B.; Beelen, V.; Collen, D.
Eur. J. Blochem. 224, 863-871, 1994
A;Title: Characterization of the murine plasma fibrinolytic system.
A;Reference number: S48202; MUID:95010076
A;Accession: S48202; MUID:95010076
   A; Accession: S48203
A; Molecule type: protein
A; Residues: 22-27 <LI2>
                                                                                   A; Molecule type: protein A; Residues: 20-25 <LIJ>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     397

> eful in treating solid
> C; Function: C;Comment: Plasminogen is converted into plasmin by plasminogen activators, both predictely after dissociation from the clot. In the presence of the inhibitor, the e inhibitor, the activation involves also removal of the activation peptide. C;Comment: Stromelysin 1 (see PIR:KCMSS1) acts on plasminogen to produce angiostate C; Comment: Plasminogen is synthesized by the kidney and is present in plasma and many C; Comment: Plasminogen is converted into plasmin by plasminogen activators, both plasminogen is converted into plasmin by plasminogen activators, both plasminogen activators, both plasminogen is converted into plasmin by plasminogen activators, both plasminogen is converted into plasmin by plasminogen activators, both plasminogen is converted into plasmin by plasminogen activators, both plasminogen is converted into plasmin by plasminogen activators, both plasminogen is converted into plasmin by plasminogen activators, both plasminogen is converted into plasmin by plasminogen activators, both plasminogen is converted into plasmin by plasminogen activators, both plasminogen activators, both plasminogen is converted into plasmin by plasminogen activators, both plasminogen activators, both plasminogen is converted into plasmin by plasminogen activators, both plasminogen activators, both plasminogen is converted into plasmin by plasminogen activators, but plasmin angiostatin

as a proteolytic urokinase-type p plasminogen factor in

precursor home
glycoprotein;
